Shreya Maharjan- Roll No: 24080299 | P.U. Registration Number: 2024-2-08-0038

Submitted to

Ace Institute of Management

Pokhara University

In partial fulfillment of the requirement for the degree of
Bachelors of Computer System and Information Technology

Kathmandu

June, 2026

SUPERVISOR RECOMMENDATION

This is to certify that this project entitled, “CareConnect” prepared and submitted by **Jenisha Karmacharya, Ocean Pandey** and **Shreya Maharjan** in partial fulfillment of the requirements of the degree of Bachelor of Computer System and Information Technology (BCSIT) awarded by Pokhara University, has been completed under my supervision. I recommend the same for acceptance by the University.

Abstract

CareConnect is a web-based Smart Donation and Volunteer Management System developed to connect donors, volunteers, and non-governmental organizations (NGOs), through a centralized digital platform. The system addresses challenges associated with traditional donation and volunteer management processes, including poor communication, lack of transparency, inefficient record management, and difficulties in volunteer coordination. CareConnect provides features such as donation management, volunteer registration, event participation, organization dashboards, reporting, and notification services.

The system is developed using modern web technologies and follows the Agile Software Development methodology. It aims to simplify social service activities by providing a secure, transparent, and user-friendly platform that enhances collaboration between stakeholders. The project is expected to improve community engagement, increase accountability, and support charitable organizations in managing their activities more efficiently.

Acknowledgement

We would like to express our sincere gratitude to our project supervisor, Sanju Shrestha, for his continuous guidance, encouragement, and valuable suggestions throughout the development of this project. We are also especially grateful to our Semester Supervisor, Ayush Dhital, for his continuous support, guidance, and encouragement during the completion of this project.

We would like to thank Pokhara University for providing us with the opportunity and resources to undertake this project as part of the Bachelor in Computer System and Information Technology (BCSIT) program.

We are also thankful to Ace Institute of Management for its constant encouragement and support, without which this project would not have been possible.

Special thanks go to our friends, classmates, and family members for their unwavering support, motivation, and encouragement throughout the project.

Finally, we would like to acknowledge everyone who contributed directly or indirectly to the successful completion of the CareConnect project. Their support and assistance have been invaluable in making this project a success.

Chapter 1: Introduction

1.1 Background

CareConnect is a web-based Smart Donation and Volunteer Management System designed to connect donors, volunteers and charitable organizations through a single digital platform. In today's world, many people are interested in helping others and supporting social causes such as orphanages, old age homes, disaster relief programs, and community welfare campaigns. However, people often face difficulties in finding a trusted and organized platform where they can easily donate money, provide necessary items, or participate in volunteer activities. Similarly, many NGOs and charity organizations struggle to manage donations, coordinate volunteers, maintain records, and communicate effectively with supporters.

With the rapid growth of internet access and digital technology, online platforms have become more practical, accessible, and efficient for social service activities. People now prefer digital systems that are fast, secure, transparent, and easy to use. CareConnect aims to use technology to bridge the gap between donors, volunteers, and organizations by providing a centralized platform where all activities can be managed smoothly.

The main purpose of CareConnect is to create a secure, transparent and reliable environment for social contribution. Through this platform, users will be able to register as donors or volunteers, donate money or items, join social events and campaigns, and track their activities in real time. Organizations will also be able to post their needs, manage volunteers, monitor donations, and maintain proper records efficiently. The system will include features such as user registration, donation management, volunteer coordination, event participation, notifications, and reporting.

CareConnect not only helps organizations reduce manual work and improve efficiency, but also encourages more people to participate in social causes by making the process simple and convenient. By improving communication, transparency, and coordination among all stakeholders, the platform aims to increase social impact and build stronger community support.

1.2 Statement of Problem

Many charity organizations, NGOs, orphanages, and social service groups still use traditional and manual methods to manage donations, volunteers and events. These methods are often slow, difficult to manage, and less effective, especially when handling a large number of activities and users.

The major problems faced by existing systems are:

1. Lack of Proper Communication
 - ❖ Poor coordination between donors, volunteers, and organizations
 - ❖ Difficulty in managing announcements and notifications
2. Manual and Inefficient Record Management
 - ❖ Donation records are often managed manually
 - ❖ High chances of data errors, duplication, and loss of information
3. Lack of Transparency
 - ❖ Donors cannot easily track how their donations are used
 - ❖ Reduced trust and confidence among users
4. Volunteer Management Difficulties
 - ❖ Volunteers face problems finding suitable campaigns or events
 - ❖ Organizations find it difficult to manage volunteer schedules and participation

CareConnect aims to solve these problems by providing a Smart Donation and Volunteer Management System that connects donors, volunteers, and organizations through a single integrated web platform. The system will improve transparency, communication, coordination, and resource management while reducing manual work and increasing social impact.

1.3 Objectives of the Study

The main objective of the CareConnect Smart Donation and Volunteer Management System is to design and develop an integrated digital platform that improves the way donations, volunteers, and charitable organizations interact and coordinate. The system aims to make social service activities more efficient, transparent and user-friendly by using modern web technologies. The specific objectives of this project are:

1. To develop a centralized platform that connects donors, volunteers, organizations, and beneficiaries, improving communication, coordination, and engagement.
2. To simplify donation and organization management by ensuring transparency, accountability, and efficient delivery of social services.

1.4 Scope of the Study

The CareConnect project focuses on creating a platform that connects donors, volunteers, and NGOs in one system. It mainly includes donation management, volunteer registration, NGO activity handling, and event participation. Users can securely register and log in, allowing different roles like donor, volunteer, and NGO to access relevant features easily. The system also provides reporting, communication, and notification services to improve coordination and transparency. NGOs can manage activities and track progress, while users receive updates about donations, events, and announcements. Overall, the scope is to make social welfare activities more organized, efficient, and accessible through a digital platform.

1.5 Limitations of the study

Due to time constraints, it was not possible to conduct more detailed research or implement every planned feature. As this is a student-level project, it does not include all the advanced functionalities found in enterprise-level systems. Limited resources, including tools, technologies, and available data, also affected the overall scope of the project. The system was tested using simulated or limited data, which may not fully reflect real-world situations. Therefore, the system does not handle large amount of users.

Chapter 2: Literature Review

2.1 Fundamental Theories and Concepts

Web-Based Information Systems

CareConnect is based on a web-based information system architecture, which allows users to access services through a browser without installing additional software. Such systems typically use client-server architecture where the frontend handles user interaction and the backend manages data processing and storage.

User Authentication and Authorization

Authentication ensures that only registered users can access the system, while authorization controls what each user is allowed to do. This is essential in CareConnect to distinguish between donors, volunteers, and administrators.

Donation Management Systems

Donation management systems are platforms designed to facilitate transparent and efficient handling of donations. They help track contributions, manage donors, and ensure proper allocation of resources.

Volunteer Management Systems

Volunteer management systems help organizations register, schedule, and coordinate volunteers for different activities and events. These systems improve communication and resource allocation.

Notification and Communication Systems

Modern web applications integrate email or messaging services to send notifications. CareConnect uses such mechanisms to inform users about events, donations, and updates.

2.2 Review of Similar Projects and Systems

To understand the current approaches used in donation and volunteer management, several existing platforms were studied:

GoFundMe

GoFundMe is a global crowdfunding platform used mainly for personal fundraising and charitable causes. Users can create campaigns to raise money for medical emergencies, education, disaster relief, and social causes. It allows individuals to share campaigns through social media and receive donations online. However, it is mostly focused on money-based fundraising, and has limited structured volunteer or organization management features.

VolunteerMatch

VolunteerMatch is a platform designed to connect volunteers with nonprofit organizations. It allows organizations to post volunteer opportunities, and individuals can search and apply based on location, interest, and skills. However, it mainly focuses on volunteering only, and does not support donation collection or integrated fundraising tools.

Salesforce Nonprofit Cloud

Salesforce Nonprofit Cloud is a comprehensive management system for large nonprofit organizations. It provides tools for donor management, fundraising tracking, campaign management, and analytics. It is very powerful but is often considered expensive and complex to implement, making it more suitable for large-scale organizations rather than small NGOs or community groups.

Charity Navigator

Charity Navigator is a platform that evaluates and rates nonprofit organizations based on financial health, transparency, accountability, and performance. It helps donors decide which charities are trustworthy. However, it does not provide fundraising or volunteer coordination features; it is mainly an information and rating system for donors.

Pressman

Pressman's Software Engineering: A Practitioner's Approach provides foundational knowledge of software development processes, including system design, testing, and maintenance. These principles guide the development of the CareConnect system by ensuring a structured and systematic approach to software engineering.

Sommerville

Sommerville's Software Engineering explains key concepts such as requirements engineering, system modeling, and software architecture. These concepts are applied in the CareConnect project to design a reliable, scalable, and user-friendly platform for nonprofit management.

2.3 Research Gap

From the review of existing systems, several gaps have been identified:

- Lack of unified platforms combining donation, volunteer, and event management.
- Limited transparency in local NGO systems.
- Poor user experience in many existing systems.
- Lack of real-time communication and notification features.
- Minimal reporting and analytics features for NGOs

CareConnect aims to address these gaps by providing a centralized, user-friendly, and transparent platform.

Chapter 3: System Analysis and Design

3.1 System Analysis

System analysis is the process of examining the requirements, objectives, and limitations of a system before its development. It helps in understanding the problems of the existing system and identifying the necessary features required for the proposed system. The main purpose of system analysis is to ensure that the developed system meets user needs and provides an effective solution to the identified problems.

The CareConnect system analysis focuses on developing a web-based platform that provides a connection between users and charitable activities. The system is designed to make information about social causes easily accessible and provide users with a simple way to participate in donation activities. It allows users to create accounts, explore different causes, make simulated donations, receive email verification, and communicate through an online platform.

The analysis of the existing system shows that many charitable activities rely on manual processes and scattered online platforms. Users often face difficulties in finding reliable information about causes, tracking donation activities, and communicating with organizations. Manual record management can also result in inefficiency, data errors, and lack of transparency.

To overcome these limitations, the proposed CareConnect system provides a centralized platform where users can access cause-related information and interact with donation services digitally. The system improves accessibility, organization, and user experience by providing features such as user registration, authentication, cause browsing, simulated donation management, email verification, contact services, and location-based functionality.

The CareConnect system is designed as a web-based donation and volunteer management platform that connects donors, volunteers, and NGOs. The main requirements were identified through analysis of existing manual and semi-digital donation systems.

3.1.1 Requirement analysis

Functional Requirements:

Functional requirements describe the main services and operations that the system performs.

1. User Registration and Role Management
 - Users can register and log in securely
 - Role-based access for Donor, Volunteer, NGOs/ Organization and Admin
 - Different dashboards based on user roles
2. Donation Management
 - Users can donate money and essential items
 - Donation submission and tracking system
 - Maintain donation history and records
3. Volunteer Registration
 - Volunteers can register and create profiles
 - Apply for available volunteer opportunities
 - Track participation in events
4. Organization Dashboard
 - Organizations can manage their activities
 - Post donation requests and volunteer opportunities
 - Track donations and volunteer applications

5. Event Management

- Create and manage events
- Users can join and participate in events
- Track event progress and status

6. Transparent Donation Records and Reports

- Maintain detailed records of all donations
- Generate reports for accountability and transparency

7. Dashboard and Analytics

- Donor dashboard to view contributions and history
- Admin dashboard with system overview and insights
- Display basic analytics such as donations and participation trends

8. Communication and Notification System

- Email notifications to donors about donations and updates
- Alerts for events and activities

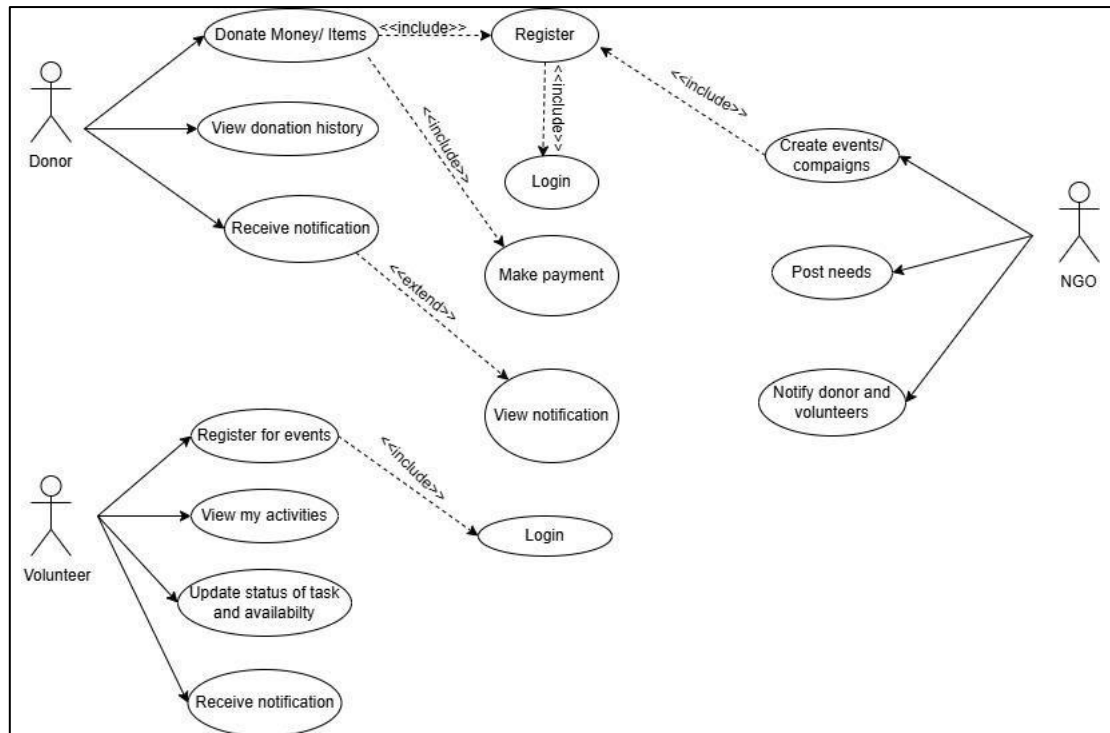

Figure 1: Use Case Diagram

Non-Functional Requirements

Non-functional requirements define the quality and performance aspects of the system.

1. Security

- Secure authentication system with password protection
- Role-based access control to prevent unauthorized access

2. Performance

- Fast response time for user requests
- Efficient handling of multiple users and transactions

3. Usability

- Simple and user-friendly interface
- Easy navigation for donors, volunteers, and organizations

4. Reliability

- System ensures accurate donation and volunteer records
- Minimal system downtime

5. Scalability

- System can handle increasing number of users and data
- Can be expanded with new features in future

6. Maintainability

- Easy to update and modify system features
- Modular design for better maintenance

3.1.2 Feasibility Analysis

1. Technical Feasibility

The system is technically feasible using modern web technologies such as HTML, CSS, JavaScript, and backend frameworks like Node.js or PHP with MySQL database support.

2. Operational Feasibility

The system is user-friendly and can be easily operated by donors, volunteers, and NGOs with minimal training.

3. Financial Feasibility

The project requires minimal cost as it uses open-source technologies and existing development tools.

4. Schedule Feasibility

The system can be developed within the academic project timeline using phased development (analysis, design, implementation, testing).

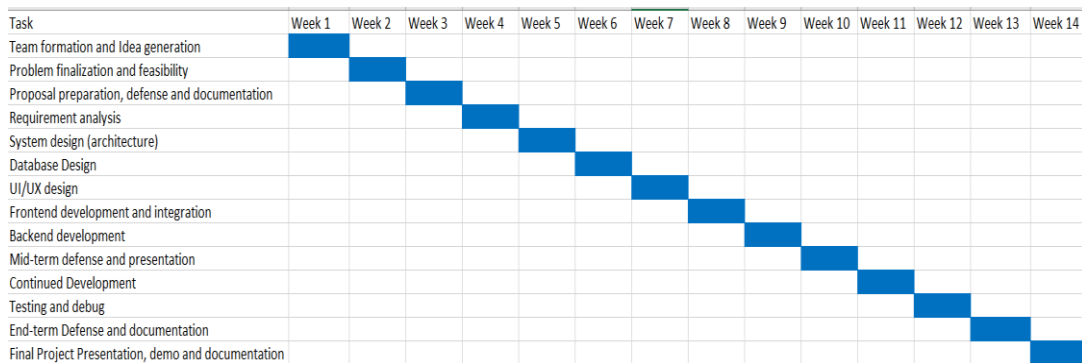

Figure 2: Gantt Chart

3.1.3 Data Modeling

The data model for CareConnect is designed to support a unified platform where NGOs, donors, and volunteers interact. It captures user management, fundraising campaigns, monetary and in-kind donations, volunteer engagement, and public inquiries. The schema ensures traceability of donations, verification of NGOs, and role-based access.

Key Entities and Relationships:

1. Users serve as the central identity, holding login credentials and role information (e.g., donor, NGO admin, platform admin).
2. NGOs are linked to users who manage them, storing registration details, focus area, verification status, and contact information.
3. Causes represent fundraising campaigns created by NGOs, tracking financial goals and amounts raised.
4. Donations record monetary contributions from users to specific causes, including payment status and frequency (one-time or recurring).
5. Item Donations handle physical goods, capturing item descriptions, meetup logistics, and status.
6. Volunteers store user availability, skills, and application status for NGO opportunities.
7. Contact Messages capture public inquiries and newsletter subscriptions.
8. A separate token table (appears as repeated index entries) manages password resets.

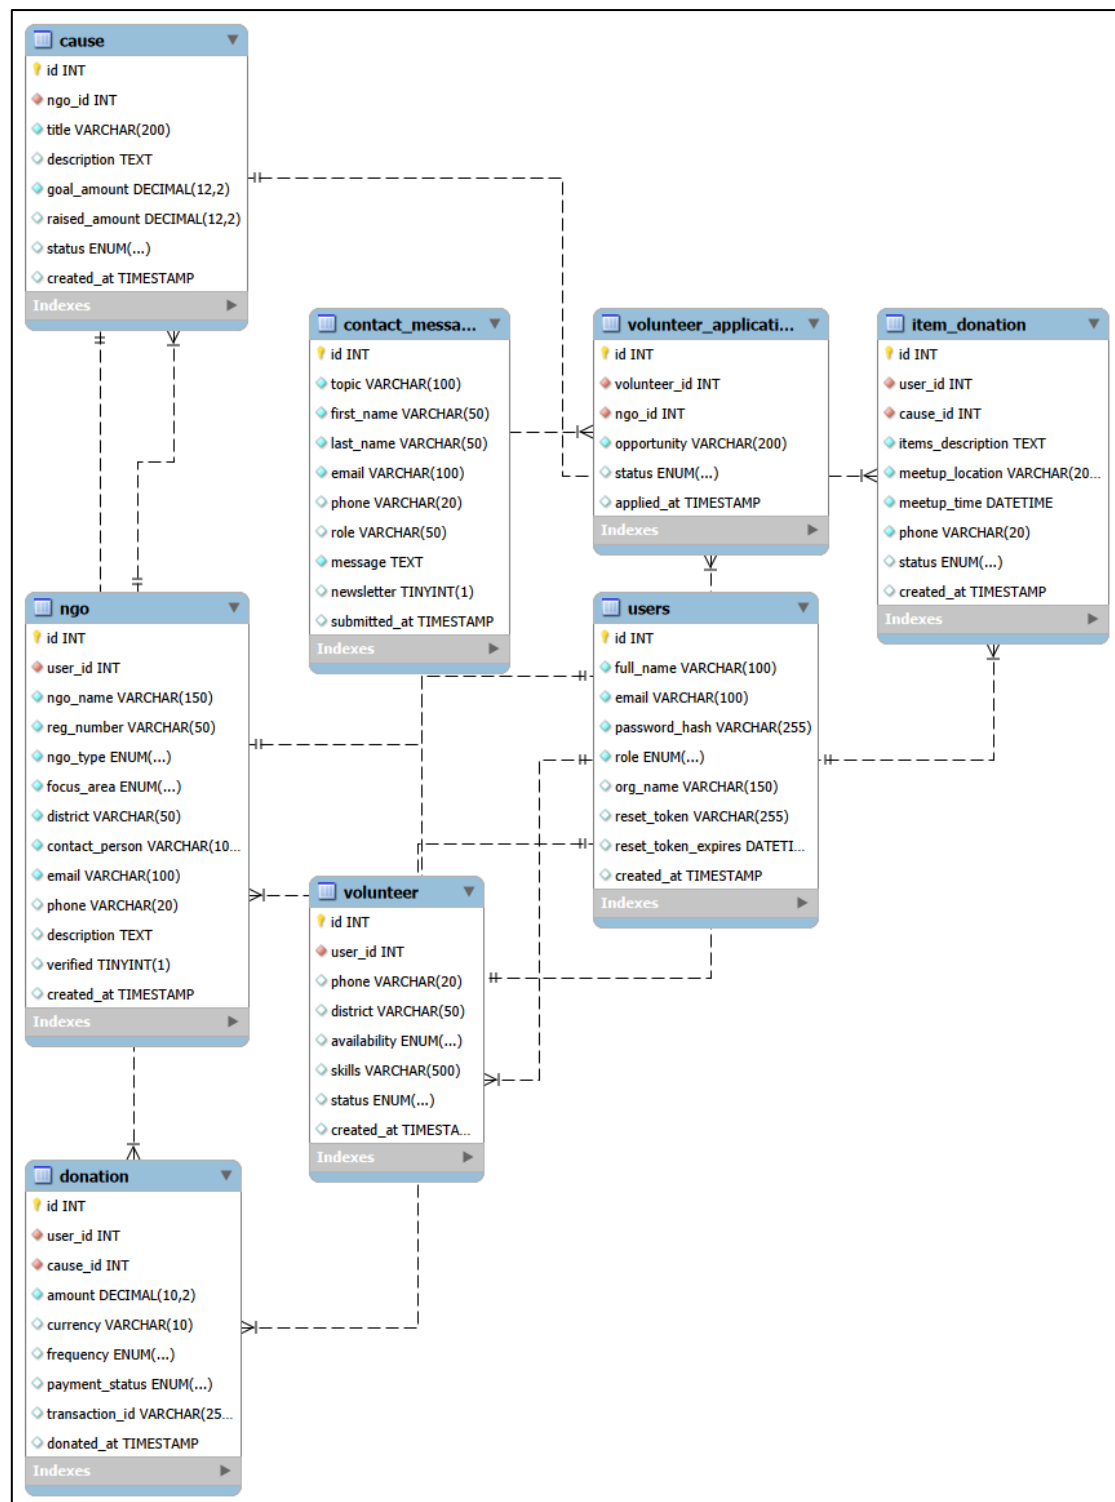

Figure 3: ER Diagram

3.1.4 Process Modeling

Process modeling describes system workflows:

- User registration → login → dashboard access
- Donor selects donation type → submits donation → confirmation
- NGO creates event → volunteers register → participation tracking
- Admin monitors system activity and generates reports

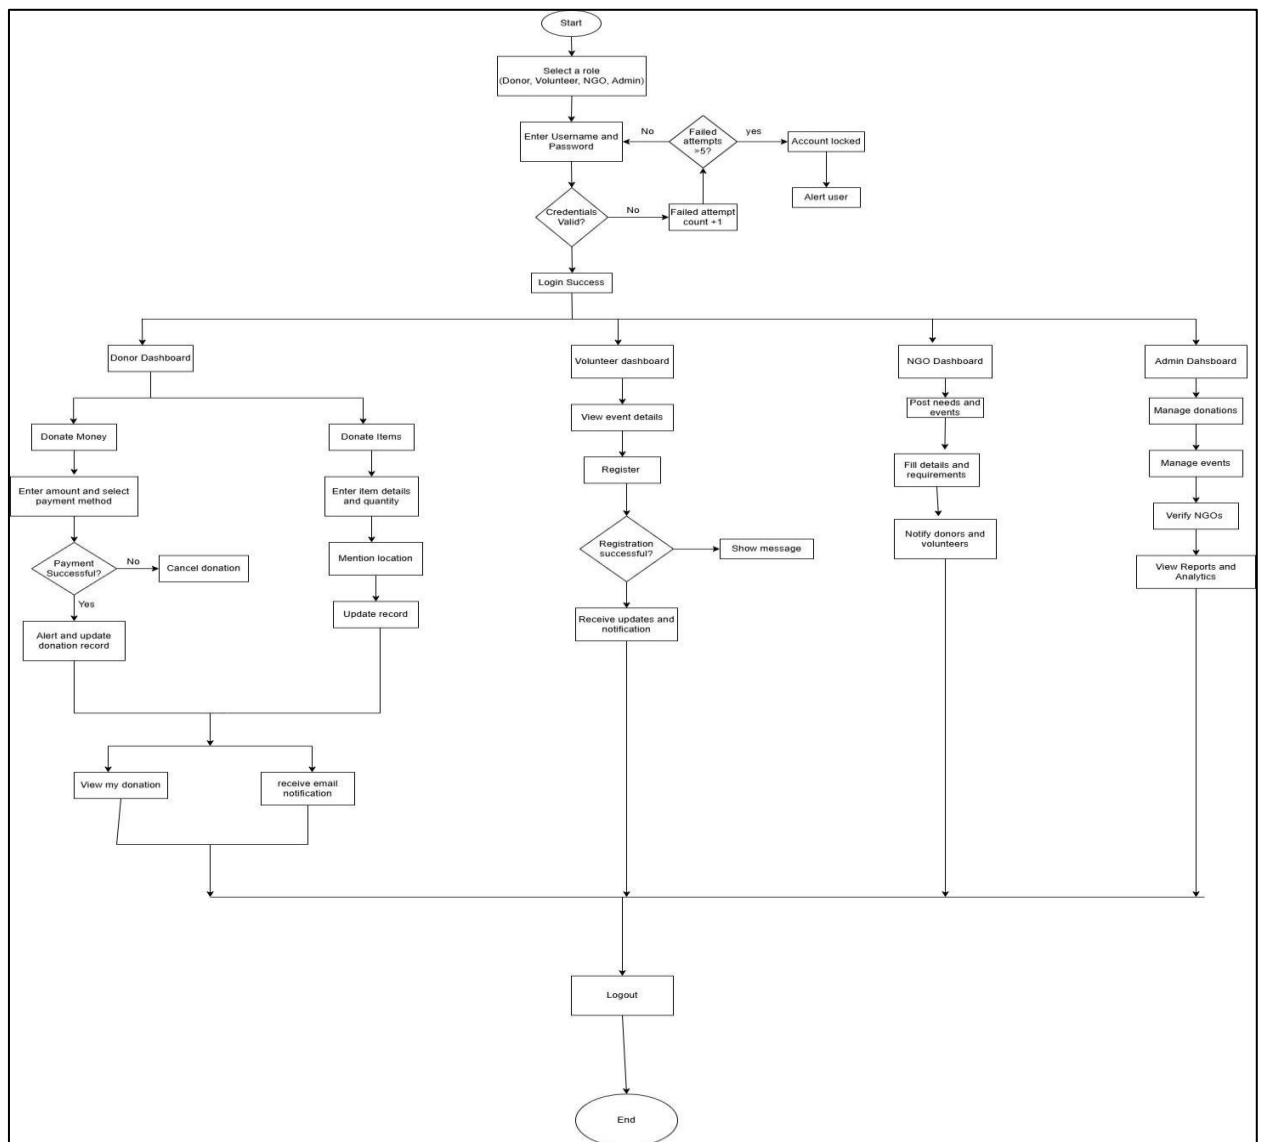

Figure 4: Flowchart

3.2 System Design

3.2.1 Architectural Design

CareConnect follows a 3-tier architecture:

- Presentation Layer (Frontend: HTML, CSS, JavaScript)
- Application Layer (Backend logic and processing)
- Data Layer (Database: MySQL)

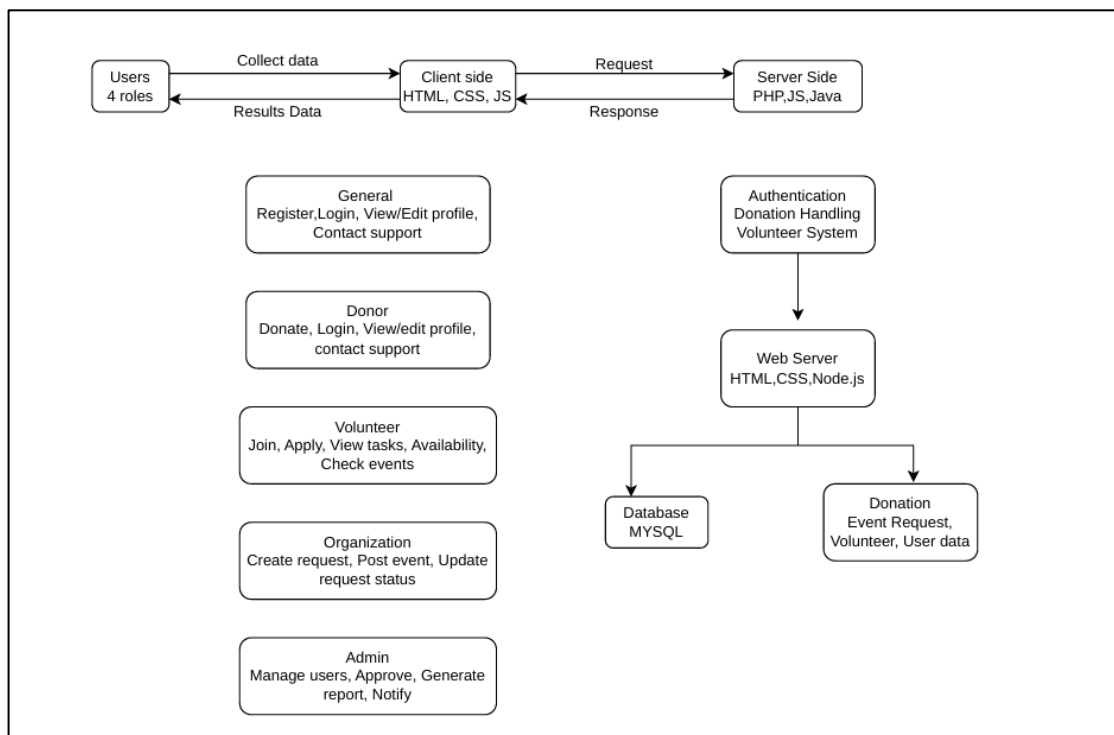

Figure 5: System Architecture

Chapter 4: Implementation and Testing

4.1 Implementation

The CareConnect project is currently in the implementation phase. At this stage, the system includes a fully designed user interface (UI) and a completed database schema. The backend logic and full system integration are still under development.

The implementation focuses on:

- Designing responsive web pages for users (donor, volunteer, NGO)
- Creating and structuring the relational database
- Preparing system modules for future backend integration

4.1.1 Tools Used

The following tools and technologies were used for the development and implementation of the CareConnect system:

Frontend Technologies:

HTML5: Used to create the structure and content of web pages.

CSS3: Used for designing the layout, styling, and improving the visual appearance of the system.

JavaScript: Used to implement client-side functionalities, form validation, and interactive features.

Backend Technologies:

PHP: Used as the server-side scripting language to handle backend operations, process user requests, manage form submissions, and communicate with the database.

Database Platform:

MySQL: Used for storing and managing system data such as user information, donation records, and contact details.

phpMyAdmin / MySQL Workbench: Used for database creation, management, and query execution.

Email Verification Service:

Brevo SMTP: Used for sending verification emails and system notifications to users after registration and other activities.

Web Hosting Platform:

InfinityFree: Used for hosting and deploying the CareConnect website online, allowing users to access the system through a web browser.

Development Environment:

Visual Studio Code: Used as the primary code editor for writing and managing frontend and backend files.

Testing Browser:

Google Chrome: Used for testing the user interface, functionality, responsiveness, and overall system performance.

4.1.2 Implementation Details of Modules

At this stage, only the UI and database modules are implemented.

1. User Interface Module

- Login and registration pages designed
- Dashboard layouts for donor, NGO, and volunteer
- Navigation bar and homepage structure completed

2. Database Module

- Tables created for users, NGOs, donations, causes, volunteers, and messages
- Relationships defined using foreign keys

3. Donation UI Module

- Donation form UI created
- Input fields prepared for future backend processing

4. Volunteer UI Module

- Volunteer registration form designed
- Application UI for NGOs created

4.2 Testing

Testing is an important phase of software development that ensures the developed system works according to the specified requirements. The main purpose of testing is to identify errors, verify system functionality, and ensure that all features operate correctly before deployment.

The CareConnect system was tested using different testing approaches, including unit testing and system testing. Unit testing was performed to verify individual modules, while system testing was performed to validate the complete integration of all system components.

The testing process focused on checking user registration, login authentication, email verification, donation processing, database operations, form validation, and overall system performance.

4.2.1 Test Cases for Unit Testing

Unit testing was performed to test individual components and functions of the CareConnect system separately. Each module was tested to ensure that it produces the expected output for different inputs.

Table 1: Unit Testing

Test Case ID	Module Tested	Test Scenario	Input	Expected Result	Actual Result	Status
UT-01	Registration Module	Verify user registration with valid details	Name, email, password	User account should be created successfully	Account created successfully	Pass
UT-02	Registration Module	Verify registration with empty fields	Empty registration fields	System should display validation messages	Validation message displayed	Pass
UT-03	Login Module	Verify login with correct credentials	Valid email and password	User should successfully log in	User logged in successfully	Pass
UT-04	Login Module	Verify login with incorrect password	Invalid password	System should reject login attempt	Error message displayed	Pass
UT-05	Email Verification Module	Verify verification email sending	Registered email address	Verification email should be sent through Brevo SMTP	Email received successfully	Pass
UT-06	Donation Module	Verify donation form submission	Cause and donation amount	Donation details should be stored	Data stored successfully	Pass
UT-07	Contact Module	Verify contact form submission	Name, email, message	Message should be submitted successfully	Message submitted successfully	Pass
UT-08	Database Module	Verify database connection	Database credentials	System should connect with MySQL database	Connection successful	Pass

4.2.2 Test Cases for System Testing

System testing was performed after integrating all modules to verify that the complete CareConnect system functions properly as a whole. The testing focused on user interaction, navigation, database communication, email services, and overall system performance.

Table 2: System Testing

Test Case ID	Feature Tested	Test Scenario	Expected Result	Actual Result	Status
ST-01	Website Navigation	Navigate through different pages	All pages should load correctly	Pages loaded successfully	Pass
ST-02	User Registration and Login	Register a new user and log in	User should be able to access the system after verification	Registration and login worked successfully	Pass
ST-03	Email Verification	Complete registration process	Verification email should be received through Brevo	Email verification completed successfully	Pass
ST-04	Donation Process	Select cause and submit donation	Simulated donation should be completed and stored	Donation process completed successfully	Pass
ST-05	Form Validation	Enter invalid data in forms	System should prevent incorrect submissions	Error messages displayed correctly	Pass
ST-06	Database Integration	Perform database-related operations	Data should be stored and retrieved correctly	Database operations worked successfully	Pass
ST-07	Responsive Interface Testing	Open website on different screen sizes	Interface should remain usable	Interface displayed correctly	Pass
ST-08	Hosting Testing	Access deployed website through InfinityFree hosting	Website should be accessible online	Website accessed successfully	Pass

Chapter 5: Conclusion and Future Recommendations

5.1 Lesson Learnt

The development of the CareConnect project provided valuable practical experience and enhanced our understanding of various aspects of software development. Throughout the project, we gained both technical knowledge and problem-solving skills that helped us successfully design and implement the system.

Some of the key lessons learned during the project include:

- Designing user-friendly and responsive interfaces using HTML, CSS, and JavaScript to improve user experience and accessibility.
- Structuring and managing relational databases using MySQL, including creating tables, defining relationships, and handling data efficiently.
- Understanding system analysis and design concepts such as Entity Relationship (ER) diagrams, data modeling, and database normalization for effective system planning.
- Recognizing the importance of modular development, proper planning, and requirement analysis before implementation to reduce complexity and improve maintainability.
- Improving teamwork, communication, and project management skills through collaboration, task allocation, and regular discussions among team members.
- Learning the importance of testing and debugging in identifying errors and ensuring the reliability and functionality of the system.
- Gaining experience in documenting project activities and preparing technical reports in a structured and professional manner.

Overall, the CareConnect project served as an excellent learning experience that strengthened our technical, analytical, and collaborative skills while providing practical exposure to real-world software development processes.

5.2 Conclusion

The CareConnect project aims to provide a centralized platform for managing donations, coordinating volunteers, and supporting NGO activities in an efficient and organized manner. The system is designed to bridge the gap between donors, volunteers, and organizations by providing a single platform that facilitates communication, participation, and resource management.

The development of this project has provided valuable insights into various aspects of software engineering, including system analysis, database design, user interface development, and project planning. It has also highlighted the importance of teamwork, effective communication, and proper documentation throughout the software development lifecycle.

CareConnect has the potential to contribute positively to society by making charitable activities more accessible, transparent, and efficient. By simplifying the process of donations and volunteer engagement, the platform can encourage greater community involvement and support for social causes.

Overall, the project represents an important step toward creating a digital solution that addresses real-world social needs. With continued improvement and enhancement, CareConnect can become a useful and reliable platform for promoting social welfare, community participation, and sustainable support for non-governmental organizations.

5.3 Recommendations

To further improve and expand the CareConnect system, the following recommendations are proposed for future development:

- Integration of a real payment gateway such as digital wallets, cards, or banking services can be implemented to support actual donation transactions and make the platform suitable for real-world use.
- The system can be deployed using a professional domain name and reliable hosting service instead of free hosting to improve accessibility, credibility, security, and overall user trust.

- The platform can be enhanced to support a larger number of users, NGOs, and donation activities by improving server capacity, database optimization, and system performance.
- Additional backend functionalities can be developed to provide complete management features, including advanced user management, donation tracking, report generation, and administrative control.
- The authentication system can be further improved by implementing advanced security features such as stronger password protection, two-factor authentication, and improved session management.
- The user interface can be continuously improved by enhancing UI/UX design, adding better accessibility features, and ensuring smooth performance across different devices.
- More comprehensive testing can be performed with real users and larger datasets to identify possible issues and improve system reliability.

Appendices

In this section, screenshots of the CareConnect project are included to provide visual evidence of the system's development and functionality. These screenshots represent different parts of the project such as the user interface, including the homepage, login and registration pages, and donation and volunteer modules.
