

Project II

Pet Adoption & Care | Student Event & Club | Smart Donation & Volunteer

Group 3: Jenisha Karmacharya, Ocean Pandey, Shreya Maharjan

1. Pet Adoption & Care System

- Many stray animals lack proper care, shelter, and medical attention
- There is no centralized system connecting adopters with available pets
- Lost pets are difficult to identify and return to their owners
- A Pet Adoption & Care System that connects animals with adopters

Problem Statement

- Stray animals and potential adopters face a lack of a centralized platform to connect, verify pet status, and manage adoption processes, which leads to low adoption rates, poor animal welfare, and difficulty in identifying lost pets.
- This project aims to develop a Pet Adoption & Care System that enables pet listing, adoption management, lost and found verification, and medical record tracking to ensure responsible and efficient pet adoption.

Objective

Purpose of the System

- To increase the adoption rate of stray and abandoned animals
- To provide a centralized platform connecting adopters, rescuers, and admins
- To ensure proper care, medical tracking, and monitoring of pets
- To reduce cases of lost pets by enabling identification and reporting

Features

- User registration and login system
- Add and manage pet listings (age, breed, health condition, location)
- Adoption request and approval system
- Lost and found pet reporting system
- Vaccination and medical history tracking
- Admin dashboard to manage users, pets, and requests
- Notification system for updates
- Secure data storage and user information management

Methodology

a) Requirement Identification

- Study existing adoption systems and animal shelters
- Identify user needs (adopters, admins, rescuers)
- Define system features such as pet listing, adoption request, and tracking

b) Feasibility Study

Technical Feasibility:

- The system can be developed using web technologies: HTML, CSS, JavaScript, backend, database

Operational Feasibility:

- Easy to use for general users and administrators.

Economic Feasibility:

- Low cost as it can be developed using open-source tools.

c) High-Level Design

The system will include:

- User Module: Registration, login, search pets, adoption request
- Admin Module: Manage pets, approve/reject requests, verify reports
- Pet Management Module: Add/edit pet details, health records
- Medical Tracking: Vaccination and treatment history
- Verification System: Report if a pet is stray or lost

d) Legal & Verification Process

Adoption Steps

- User fills online adoption application form
- Upload valid ID
- User agrees to adoption terms (proper care, no abandonment, medical responsibility)

Admin reviews:

- Basic details + ID proof
- Admin approves or rejects the request

Real-world extension:

- Simple phone call verification

Stray vs Lost Pet Identification

- Users can report animals with photo and location
- System checks against “lost pet” database
- If matched → notify original owner
- If not → mark as “available for adoption”
- Admin verifies before listing

Expected Outcome

After completion, the system will:

- Provide a centralized platform for pet adoption
- Increase adoption rates of stray animals
- Ensure proper medical tracking and care
- Reduce cases of lost pets through identification system
- Promote responsible and legal pet ownership
- Help organizations and communities manage animal welfare effectively

2. Student Event & Club Management System

In many colleges, student clubs play a vital role in extracurricular activities and student engagement. However, managing club events, members, and participation records is often done manually or through scattered platforms like social media and messaging apps. This creates confusion, inefficiency, and poor coordination.

Problem Statement

College students and club organizers face difficulties in managing events, members, and attendance in an organized way, which leads to poor communication, data mismanagement, and low participation in club activities.

This project aims to simplify event management, member registration, and attendance tracking.

Objectives

- To enable easy event creation and announcements
- To provide a simple member registration system
- To implement an efficient attendance tracking feature
- To improve communication between club members and organizers

Features

- User registration and login system
- Event creation and announcement
- Member registration for events
- Attendance tracking system
- Dashboard to view events and activities

Methodology

The project will be developed using a structured approach:

Requirement Identification

- Identify the need for a centralized system to manage club events and members
- Collect requirements from students and club organizers
- Define key features like event management, registration, and attendance tracking

Feasibility Study

Technical Feasibility

- The system can be developed using basic web technologies: HTML, CSS, JavaScript, backend, database

Operational Feasibility

- Easy to use for both students and admins
- Improves efficiency and reduces manual work

Economic Feasibility

- Low development cost
- Uses free or open-source tools

High-Level Design

- Frontend: User interface for students and admins
- Backend: Handles logic, requests, and data processing
- Database: Stores user, event, and attendance data
 - Modules: User Management
 - Event Management
 - Registration System
 - Attendance Tracking
 - Notification System

Expected Outcome

- A fully functional web-based platform for managing club activities
- Simplified event management and announcements
- Efficient member registration and attendance tracking
- Improved communication and coordination within clubs
- Reduced manual work and better data organization

3.Smart Donation & Volunteer Management System

- It connects donors, volunteers and organization in one centralized system.
- It improves transparency and trust by maintaining clear donation records.
- The system allows donors to contribute money or essential items such as foods and clothes.
- Volunteers also can register and participate in events organized by the institution.

Problem Statement

Many organizations still manage donations and volunteers manually. This leads to:

- Lack of transparency
- Inefficient resource distribution
- Poor communication between donors, volunteers, and organizations

There is no centralized system to track donations and coordinate volunteer activities effectively.

Objective

- To improve transparency in donation processes.
- To allow donors to contribute money or items conveniently.
- To enable organization to post their needs easily.
- To help volunteers register and participate in activities.
- To enhance coordination and communication among all users.

Features

- Volunteer registration & Participation management
- Donation request & contribution system
- Organization dashboard to post needs and manage requests
- Campaign & event mangement system
- Notification setting for updates and reminders
- Donation tracking & reporting system
- User authentication

Methodology

a) Requirement Identification

- Study the existing system(manual donation & volunteer mangement)
- Identify problem like lack of transparency and poor communication.

b) Feasibility Study

Technical Feasibility

- System can be developed by using web technologies(HTML, CSS, JavaScript, Database)

Operational Feasibility

- Can be used by NGOs, donors and volunteers easily

Economic Feasibility:

- Reduces manual work and saves time/resources.

c) High-Level Design

- User register/log in (select role donor, volunteer, organization)
- Donors donate money/items
- Organizations post needs
- Volunteers register and join activities
- Admin monitors: Donation, volunteer activities, requests
- System automatically: Updates records, sends notification, tracks progress

Expected Outcome

- Better coordination between all users
- Efficient use of resources
- Increased transparency
- Stronger community involvement
